

2025 White Lake Smart Buoy Updates & Data Analysis

(Using 1st full season of buoy data, Jun 6-Oct 12, comparing with 2024 GVSU/AWRI & CLMP Data)

Jim DeBoer – Chief Science Officer (CSO)

White Lake Association (WLA)

December 3, 2025

WLA Smart Buoy – Upgrades for 2026

- Thanks to an additional “Smart Buoy Upgrade” grant from EGLE (\$6227, contract just completed), we will be adding the following sensors to our WLA Smart Buoy in 2026:
 - **Conductivity** – Measurement of dissolved salts from non-point source runoff
 - **Turbidity** – Measurement of sediment suspension, relative water visibility/clarity
 - **pH** – Measurement of acidic or basic tendencies of the water over the course of the season
- The upgrade grant also funded a “mid-depth” dissolved oxygen sensor rigging and data cable
 - This will enable us to move our bottom D.O. sensor to mid-depth once oxygen is depleted at the bottom OR add a 3rd dissolved oxygen sensor in the future (as funding allows)

White Lake Smart Buoy (above),
EXO Sonde Sensor Suite Example (below)

EXO pH, Turbidity, and Conductivity Sensors
(left to right)

NexSens Clamp Kit, Splitter, and 10m Data Cable
(left to right)

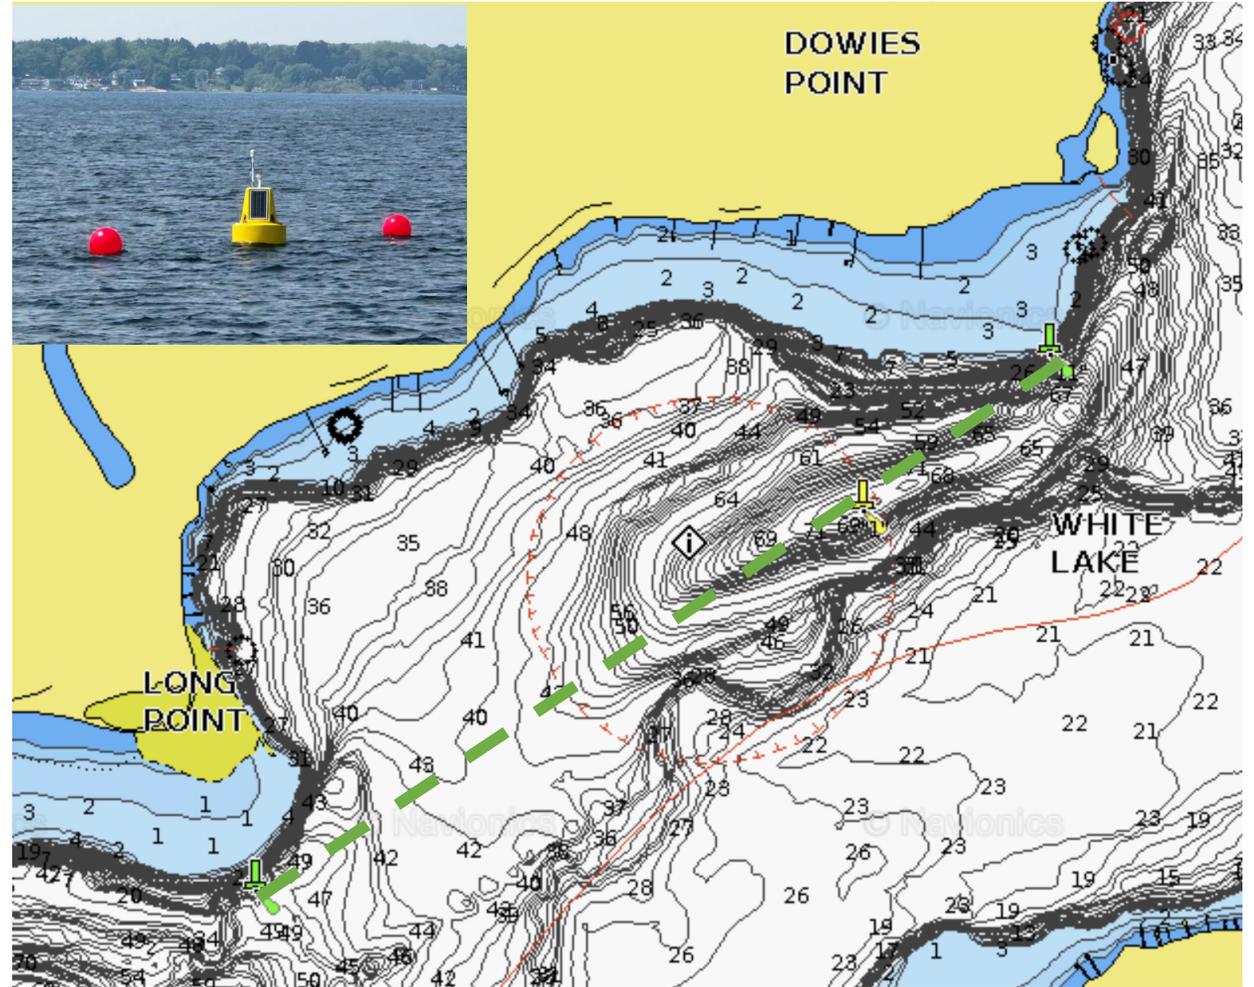

The WLA Smart Buoy will be even more capable in 2026, with all data made available to the community 24/7 via the “Public Portal”

WLA Smart Buoy – Adjustment for 2026

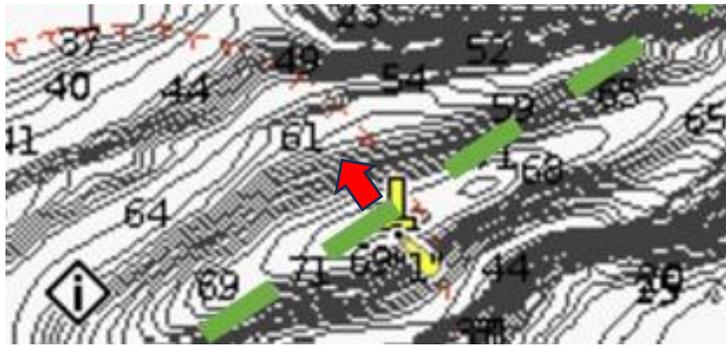

- The WLA Smart Buoy is close to the common navigation channel between the two green buoys
 - This placement was approved by the Coast Guard, US Army Corps, EGLE, and the Michigan DNR
 - This location has been added to marine maps
- We received messages this summer it was “hard to see” and in a “high traffic” spot
 - Tried increasing the intensity of the CG-approved flashing yellow light (already at max)
- The current plan is to move the buoy 50-100ft NW to remain in deep water (EGLE/WLA desire) while increasing spacing from the “green line”
 - We are also considering adding lights to the red mooring balls themselves to increase visibility

Courtesy of Garmin/Navionics

Move
~100ft

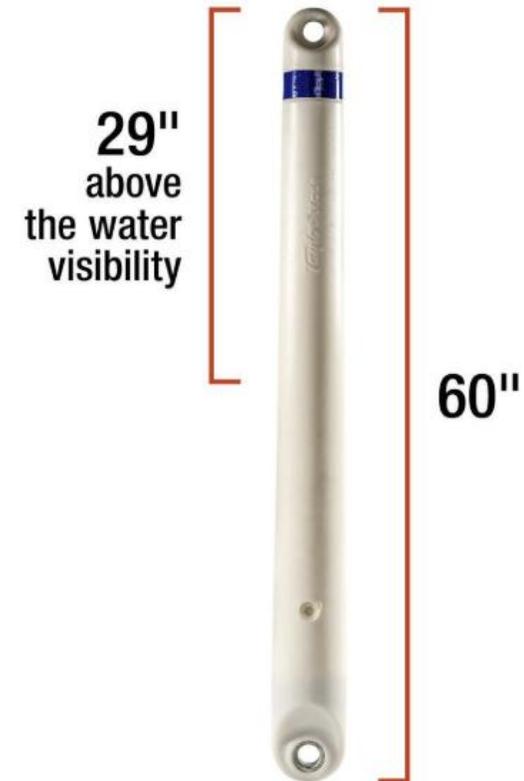

WLA will make efforts in 2026 to both move the buoy further from the navigation channel and increase visibility via brighter/additional lights that still meet Coast Guard color/flashing requirements

WLA Smart Buoy – “Winter Sticks” for Off-season

- Due to the potential for ice on White Lake in the location of the Smart Buoy, we need to plan for Smart Buoy removal and mooring line protection (to re-deploy in Spring 2026)
- Dan McCormick (South Shore Marina) recommends “Winter/Sully Sticks” as ice-resistant floats for the mooring lines
- John Hanson and a couple others will use John’s boat to pull the buoy and replace the mooring balls (TBD on moving location)
- Smart Buoy will be stored and sensors cleaned/capped in DeBoer’s garage

Specifications:

- Small Sully Stick:
 - Color: White
 - Dimensions (L x W): 31" x 6"
 - Buoyancy rating: 15 lbs
 - Offers 18" visibility above water line
- Large Sully Stick: ***Purchased 2, received 9/27***
 - Color: White
 - Dimensions (L x W): 60" x 6"
 - Buoyancy rating: 31 lbs
 - Offers 29" visibility above water line

The Snow Farmers (John Hanson) once again offered to help with Smart Buoy logistics – removed the Smart Buoy on Oct 12, replaced the Red Mooring Balls with Winter Sticks

WLA Smart Buoy – Public Portal for Real-time Data, 24/7

- Anyone can access the Public Portal for free via phone or computer using the following link (or QR code to the right):
 - <https://www.wqdatalive.com/public/2305>
- An App exists for iOS/Android, but it's fairly "buggy" at the moment
 - WLA will let members know if/when this changes/improves
- IF anyone wants access to ALL data collected by the Smart Buoy (can specify any parameters and date range):
 - Create an account on WQDataLive.com
 - Send WLA an email requesting "Collaborator" status
 - We have also posted a full .xls download of the 2025 raw data for likely parameters of interest (LARGE file since data every 10min)

White Lake Association (WLA) Smart Buoy POWERED BY WQData LIVE
Observational buoy on White Lake Monday, September 29th, 2025

The White Lake Association (WLA) is comprised of hundreds of area residents who care deeply about White Lake. Our members support WLA activities and actions that preserve the natural amenities of the lake, as well as the public trust. The Smart Buoy is the latest addition to WLA's water quality monitoring capabilities, and has been funded in part through Michigan Department of Environment, Great Lakes, and Energy's (EGLE) Watershed Council Grant Program.

Thanks to funding from the City of Montague and City of Whitehall, WLA Smart Buoy data is available 24/7 via this Public Portal.

The WLA Smart Buoy (funded by an EGLE grant) and "Public Portal" interface (funded by City of Montague and City of Whitehall) performed extremely well in 2025, both will be adjusted/upgraded in 2026

Score-the-Shore – GoPro Video Capture

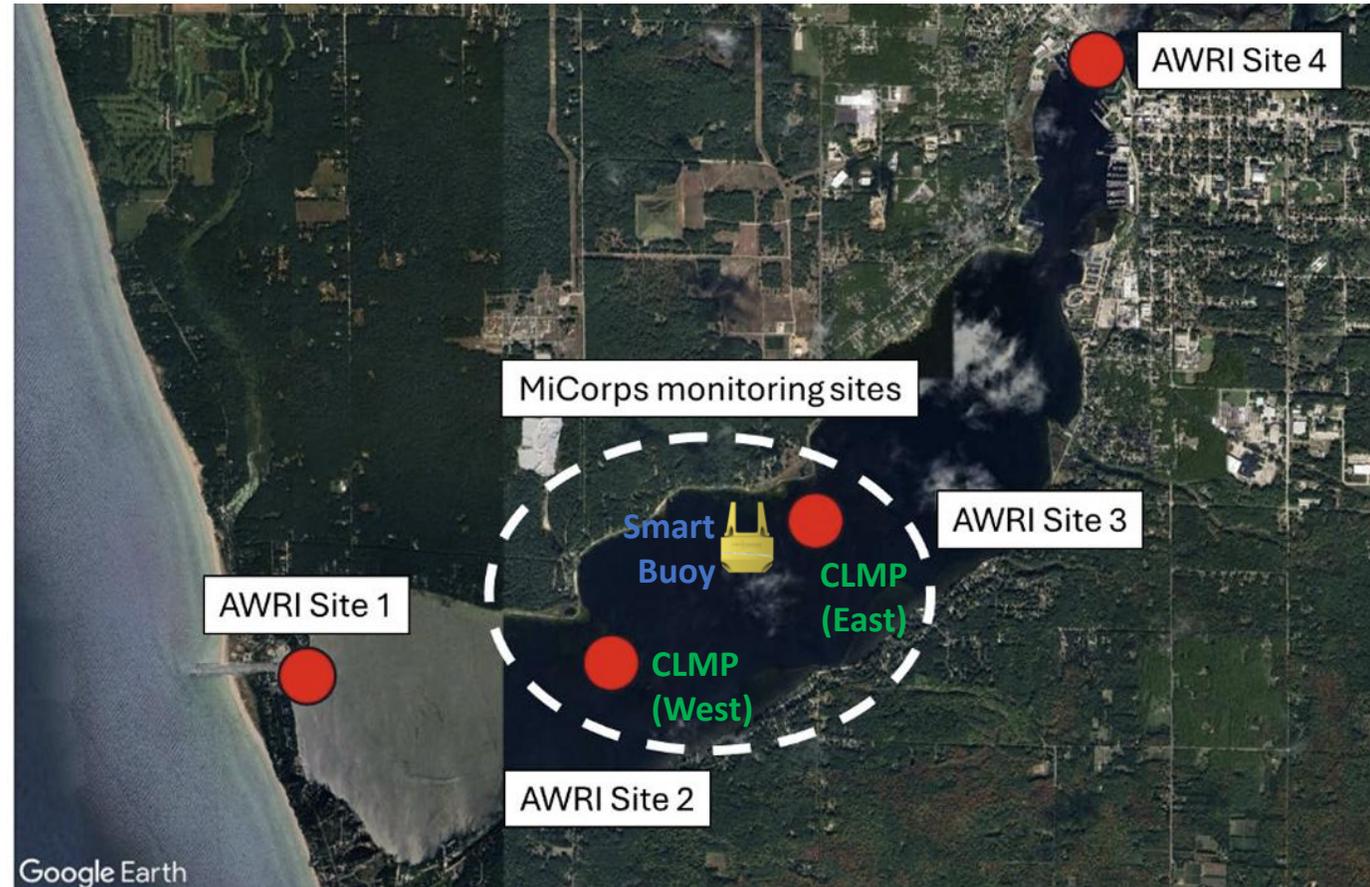

- GVSU-AI project team defined (61) ~1000ft segments around White Lake, following MiCorps/CLMP guidelines
- Each segment is defined by a set of start and end GPS waypoints, which DeBoer converted to .gpx file format and loaded into Garmin Navionics SW
 - Enabled auto-navigation with Garmin trolling motor, with GoPro video capture (61 separate videos captured)
 - Can use same GPS waypoints to define segments in drone imagery capture for additional perspective
- Bob/Sara captured additional video/imagery for the 2025 “repository”

Significant shoreline video/imagery capture in 2025 provides excellent material for potential follow-on GVSU AI project in the “off-season”, process established with lessons learned

Analysis Overview

- The analysis focuses on (3) separate sources of data:
 - GVSU-AWRI “White Lake 2024 Monitoring Report” (4 sites)
 - 2024/2025 MiCorps Cooperative Lakes Monitoring Program (CLMP) Data (2 sites)
 - 2025 (Jun 5 – Sep 23) WLA “Smart Buoy” Data (1 site)

Courtesy of GVSU-AWRI “White Lake 2024 Monitoring Report”

The WLA Smart Buoy dramatically increased water quality monitoring capability in 2025, with further improvements planned for 2026

Motivation – WLA Monitoring Responsibilities/Goals

4.2 Eutrophication or Undesirable Algae, removed April 2012

The MDEQ accepted the locally-developed target for the Eutrophication and Undesirable Algae BUI as being functionally equivalent to the restoration criteria in the *Guidance*, while remaining within the scope of the AOC program. According to the White Lake PAC's criteria, the Eutrophication and Undesirable Algae BUI was to be considered restored when:

- 1) no waterbodies within the AOC are included on the list of impaired waters due to nutrients or excessive algal growths in the current Clean Water Act Water Quality and Pollution Control in Michigan: Section 303(d) and 305(b) Integrated Report; and
- 2) the following average annual concentrations/values meet criteria in White Lake after 5 years.

- Total Phosphorus – 30 µg/l
- Chlorophyll a – 10 µg/l
- Secchi Disk depth ~2.0 m
- Trophic Status Index – 50-55

5. POST-DELISTING RESPONSIBILITIES AND MONITORING

While AOC-based restoration work is complete and all eight BUIs have been removed from the White Lake AOC, it is prudent to monitor natural system recovery, particularly as it relates to wildlife. Relatively speaking, changes in wildlife habitat should be reflected in the populations and community assemblages within a short time period. The Muskegon Conservation District has agreed to conduct avian and amphibian population monitoring in consultation with Bird Studies Canada, and with the support of the MDEQ and the USEPA during 2014, 2015, and 2016. A final report will be submitted in early 2017 that chronicles the findings of the monitoring program which actually began in the area in 2006. It is anticipated that the results may show significant changes in both bird and frog communities, given their susceptibility to habitat alteration. White Lake wetland and riparian habitats appear to have improved during the period so far. This monitoring program is intended to demonstrate and quantify to what extent those improvements are changing faunal community makeup.

White Lake Area of Concern Final Delisting Report

Great Lakes Management Unit
Office of the Great Lakes
Michigan Department of Environmental Quality

August 2014

Independent from the restoration of BUIs and delisting of the White Lake AOC, White Lake Association members voluntarily monitor water quality parameters at regular intervals, following protocols established through the Michigan Clean Water Corps. This includes tracking changes in the lake's nutrient concentrations and trophic status, assessing the lake's macrophyte community (including native and nuisance exotic species), and maintaining vigilance for potential introductions of invasive plant and animal species (including cyanobacteria).

Summary of 2024 White Lake Water Testing Results

The CLMP is brought to you by:

- (Spring/Summer)*
- *Total Phosphorus – 30 µg/l*
 - *Chlorophyll a – 10 µg/l*
 - *Secchi Disk depth ~2.0 m*
 - *Trophic Status Index – 50-55*

WEST (LONG)	EAST (DOWIE)
14/21 ug/l	26/22 ug/l
6.4 ug/l	6.6 ug/l
2.8 m	2.9 m
47	47

*Example of good downward trend
(White Lake EAST Summer Phosphorus)*

2024 water testing results (not available until Spring 2025, exception of Secchi) suggest White Lake remains in “good” health, no strong/worrisome trends, still meeting the 2014 de-listing requirements

Summary of 2024 Trophic Status Index (TSI)

Increasing
weed/algae growth

Oligotrophic: Generally deep and clear lakes with little aquatic plant or algae growth. These lakes maintain sufficient dissolved oxygen in the cool, deep-bottom waters during late summer to support cold water fish, such as trout and whitefish.

Mesotrophic: Lakes that fall between oligotrophic and eutrophic. Mid-ranged amounts of nutrients.

Eutrophic: Highly productive eutrophic lakes are generally shallow, turbid, and support abundant aquatic plant growth. In deep eutrophic lakes, the cool bottom waters usually contain little or no dissolved oxygen. Therefore, these lakes can only support warm water fish, such as bass and pike.

Hypereutrophic: A specialized category of eutrophic lakes. These lakes exhibit extremely high productivity, such as nuisance algae and weed growth.

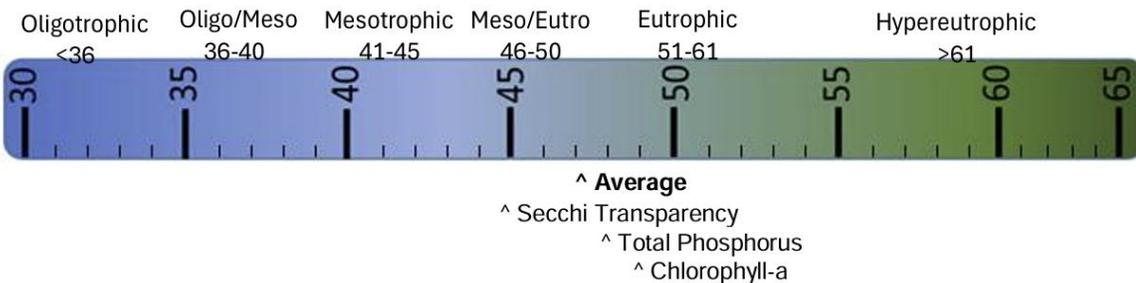

Secchi Depth (ft)	TSI Value

WHITE LAKE – WEST (LONG POINT)

TSI for White (West) Lake in 2024	
Average	47
Secchi Disk	45
Summer TP	48
Chlorophyll-a	49

WHITE LAKE – EAST (DOWIE POINT)

TSI for White (East) Lake in 2024	
Average	47
Secchi Disk	45
Summer TP	49
Chlorophyll-a	49

2024 Trophic Status Index (TSI) for both WEST and EAST sites is in the Mesotrophic/Eutrophic “mid-range”, which continues a slight trend toward Mesotrophic (otherwise very stable over last 10-15 years)

Summary of 2025 CLMP Data Collection

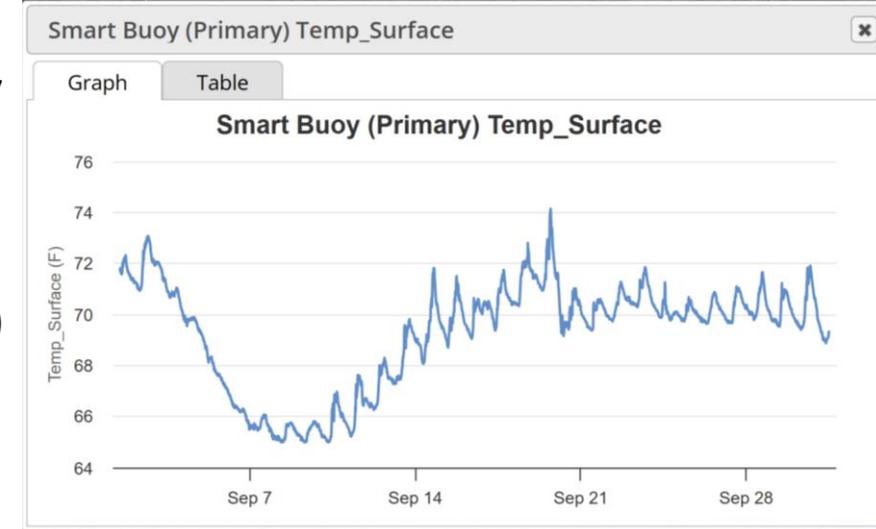

- After Spring Phosphorus collection in April (thanks, Greg/Debi!), there were **(10) total water sampling trips** to both West & East sites this summer:
 - All (10) collected Secchi, and Temperature / Dissolved Oxygen from surface to bottom(~55ft)
 - (5) of the (10) collections also included Chlorophyll-a sampling (monthly)
 - The last sample collection (Sept 11) also included Summer Phosphorus sampling
- Special thanks to Bob and Sara for supporting early and late water sampling in 2025, as well as making both deliveries of samples to downtown GR for MiCorps lab processing
- A final October sampling for Secchi/Temp/D.O would be “nice to have”, but **Smart Buoy capability largely offsets the need to prioritize late collection**
- **Recommendation: Purchase 2nd YSI Pro20 Dissolved Oxygen meter to ease logistics**
- Volunteers are always welcome!

The 2025 CLMP “manual, by boat” water sampling met all collection requirements, all samples have been submitted and data entered online to support MiCorps lab analysis – results expected Spring 2026

Summary of 2025 CLMP/Smart Buoy Data Trends

- We have to wait for CLMP Phosphorus, Chlorophyll-a, and Trophic Status updates (~Spring 2026)
- However, Secchi/temperature/dissolved oxygen collection and Smart Buoy data analysis suggests the following for 2025:
 - **Water clarity (Secchi) is roughly the same as 2024** (October collection would likely bump up our average)
 - **Water temperature was relatively high** (similar to previous years) with early summer slightly higher and late summer slightly lower than 2024, hitting a **peak of 81.5 F on the surface (July 29)**
 - Dissolved oxygen followed similar trend as previous years, **Smart Buoy enabled identification of date when bottom (~71ft) hit 0 (July 8)**
 - **Observed temporary thermal turnover/mixing Sep 3-7**, which resulted in ~2wks of dissolved oxygen at the very bottom
 - Chlorophyll-a levels (from Smart Buoy, taken near surface, “worst case”) were relatively low, **with C-a reaching a peak of ~8 ug/l (July 1)**
 - We **did NOT observe any toxic/blue-green algae** (at Smart Buoy)
- **A deeper dive into the data can be seen in later slides, will be posting data and analysis to WLA website**

The WLA Smart Buoy has collected/recorded a massive amount of data that should continue to be analyzed over the off-season, and ultimately compared to 2025 CLMP results. Overall GREAT addition!

Other Ideas

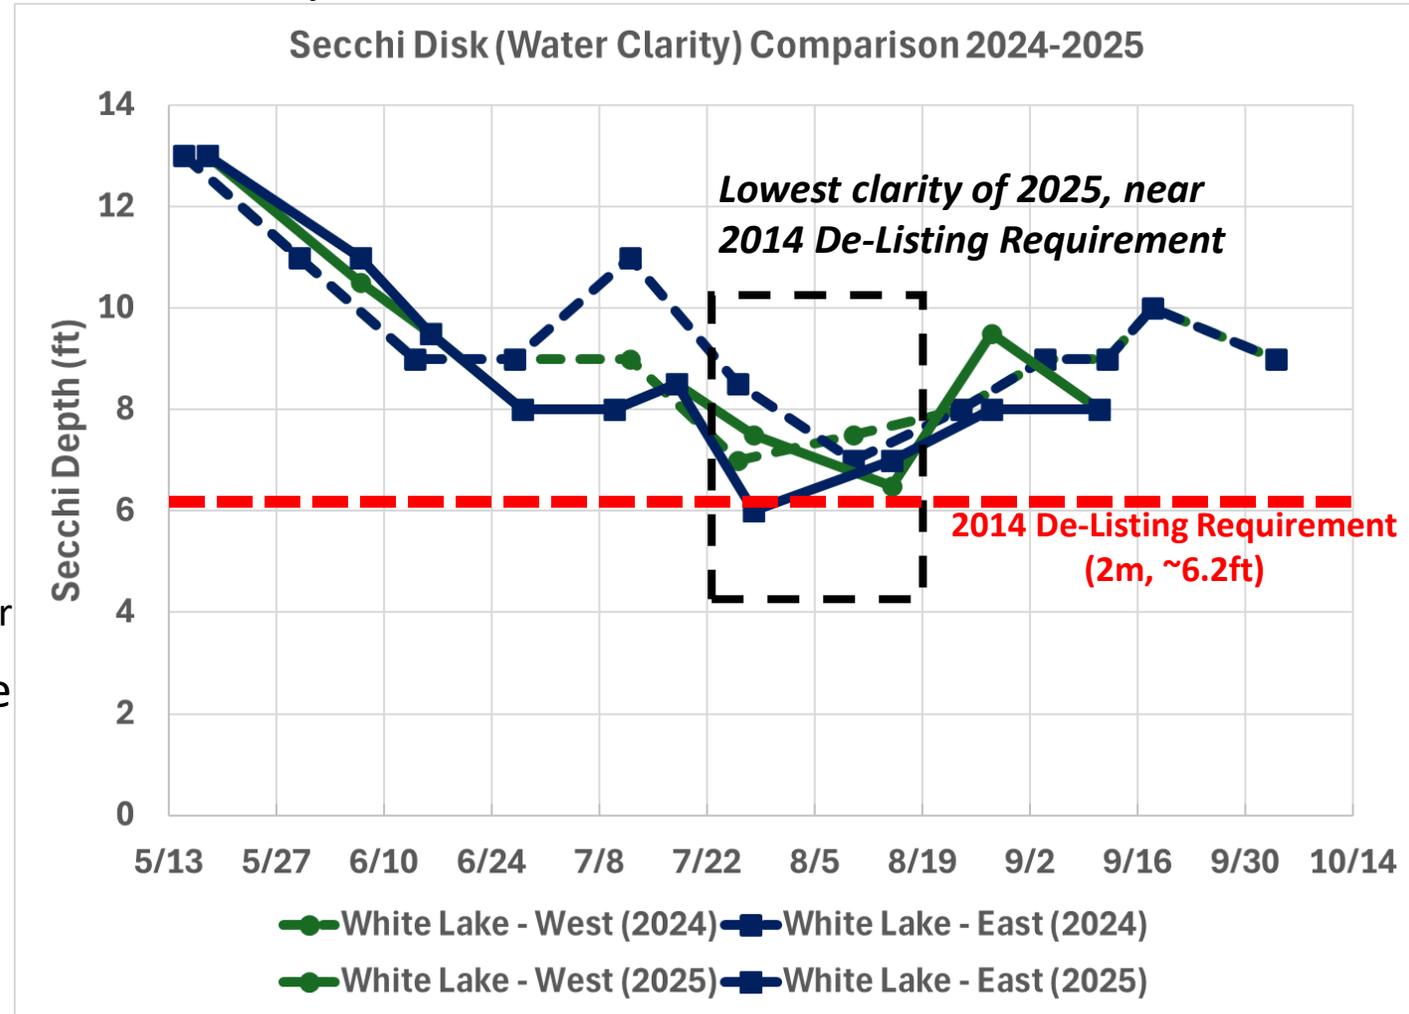

- Wave estimation HW mounted near shoreline/seawall to help quantify the impact of wake boats, support potential future ordinances and/or legislation
 - Wake boats have become a significant discussion topic, likely increasing in future
- Smaller buoy(s) that can be strategically placed/relocated in shallower water near marinas, bridge, upriver, etc.
 - Ideally, this would tie into the same “Public Portal” so accessible/viewable by all 24/7
 - More likely to catch the worst algae blooms, warning of toxic algae
- Updated White River Watershed Plan, funded by EGLE grant
 - See slides at end of presentation with background material, likely on hold due to shutdown
 - Regardless, recommend anyone interested reviewing the excellent, thorough 2009 WRWP Plan

Would love to hear from the community about other things WLA should pursue, or how you'd like to volunteer/help with all the exciting things going on!

Start of Detailed Data Analysis

Looking at Water Clarity (Secchi Disk)

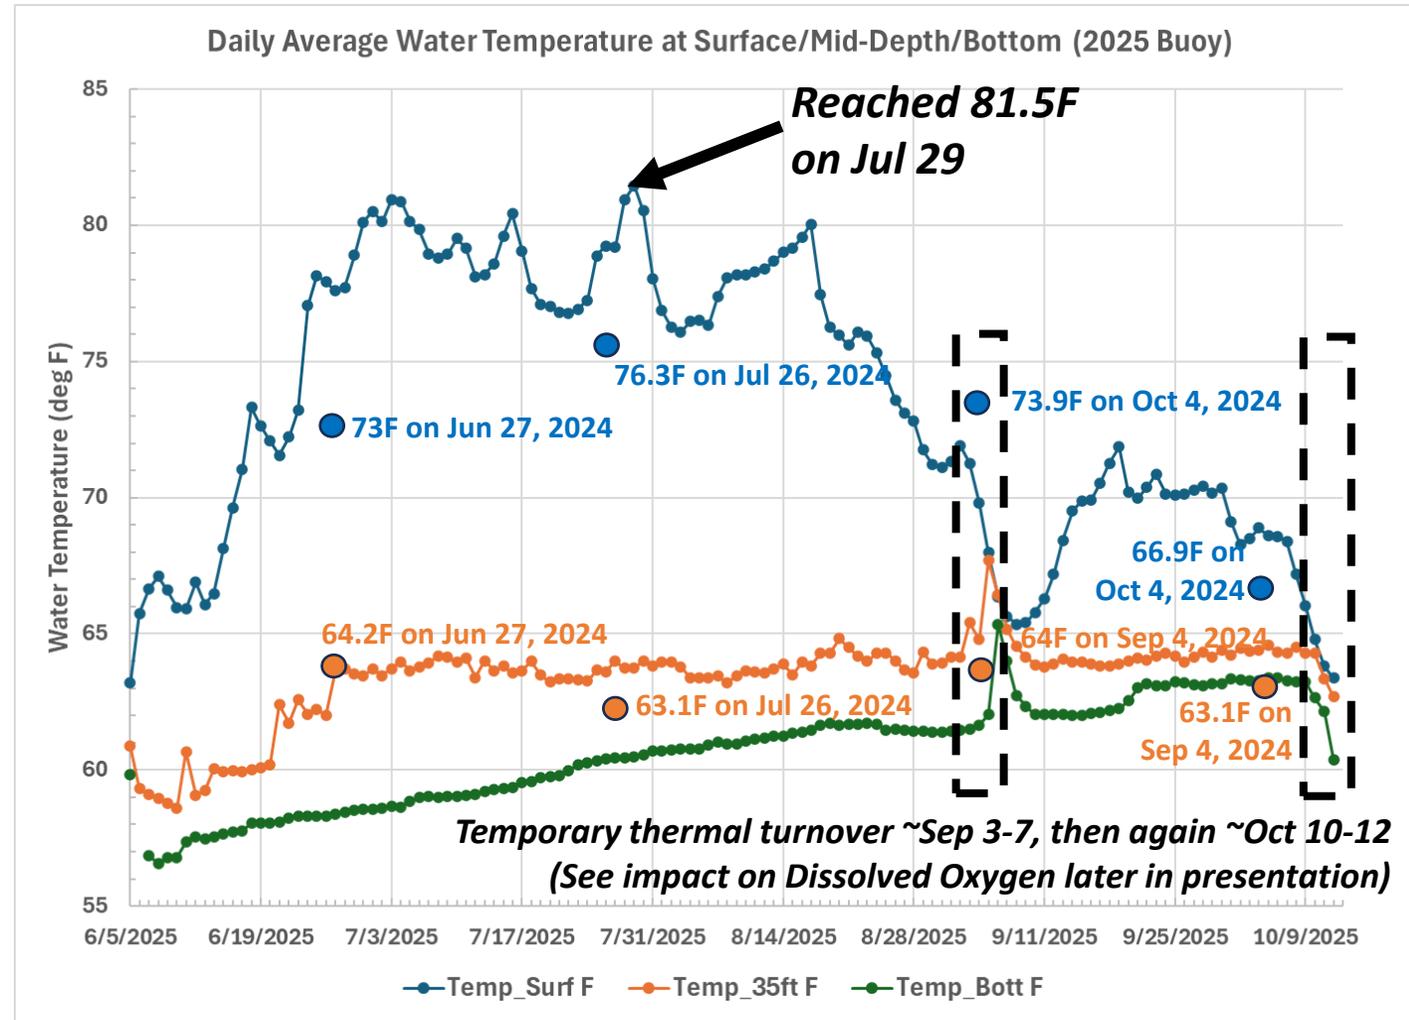

- Water clarity followed a similar trend to previous years
 - Max: 13ft (mid May), Min: 6ft (late July)
 - Comparable to 2024 data
- The White Lake East (Dowie's Point) clarity saw sharp drop in mid-late July
 - Not completely unexpected with higher temperatures and algae growth
 - See next slide for likely additional contributor
- The addition of a Turbidity sensor on the Smart Buoy in 2026 will enable us to quantify the relative amount of suspended sediment
 - This will NOT replace Secchi disk measurements, but interesting to compare

Secchi disk measurements continue to be a relatively simple, yet highly valuable means of assessing water clarity, will compare/correlate with new turbidity measurements on Smart Buoy in 2026

Looking at Temperature

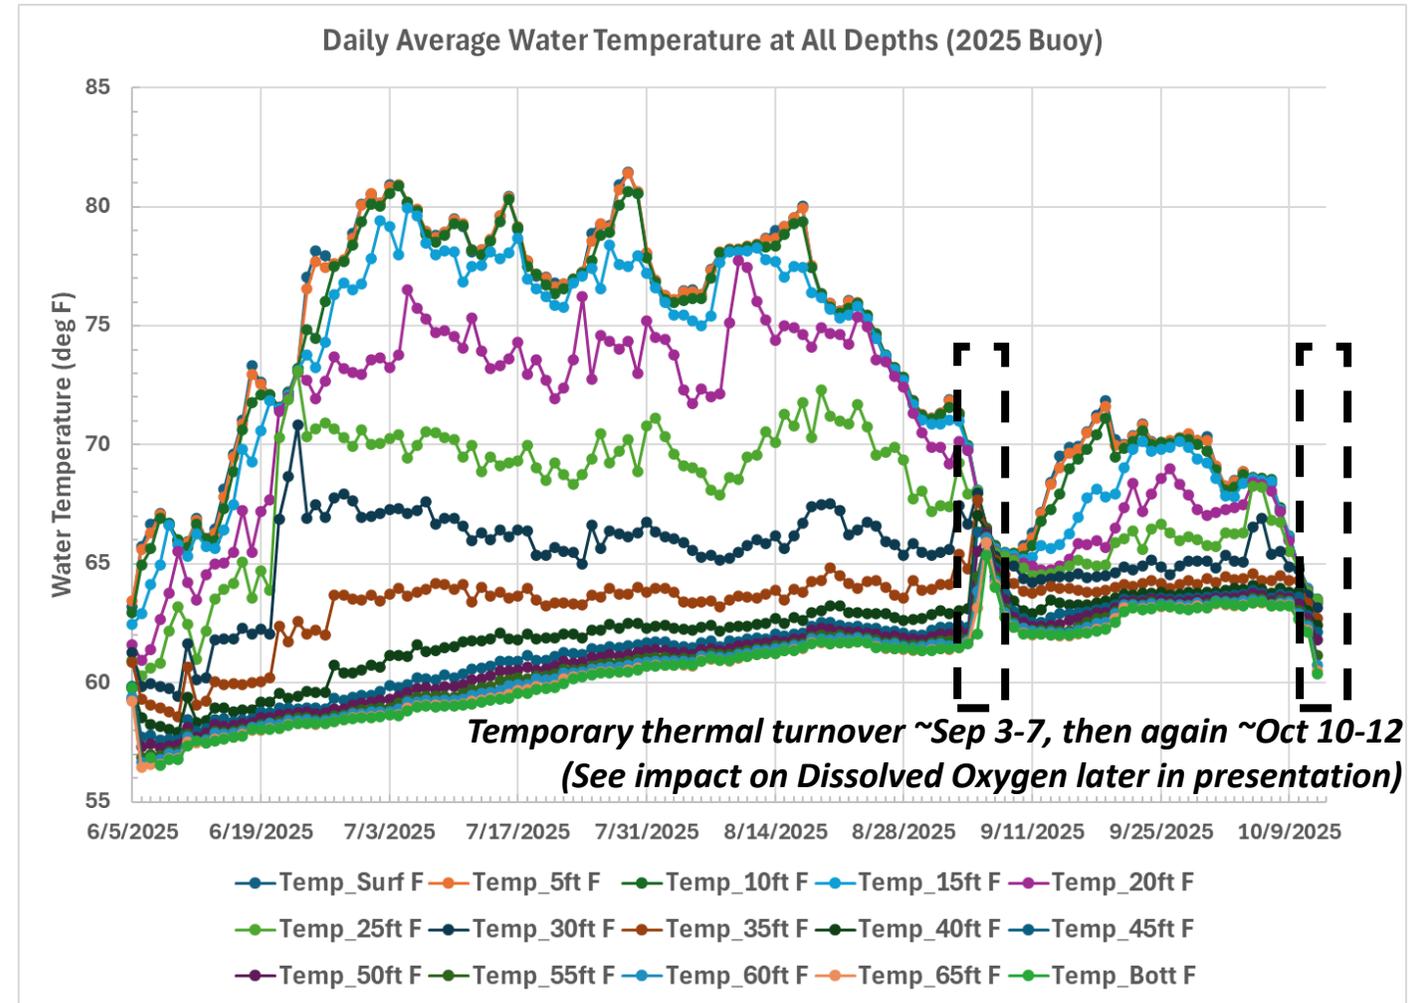

- 2025 Smart buoy temperature measurements are collected via a thermistor string that extends from the surface to the bottom
 - 0-70ft, every 5ft
 - This is similar resolution, but greater depth than our bi-weekly manual collections
 - Data is updated every 10 min
- 2025 daily averages are plotted here to give a sense of surface, mid-depth, and bottom temperature variation over Summer 2024
 - A much more gradual variation is observed on the bottom, as expected
- Experienced a temporary, thermal turnover in early Sept, then in Oct right before pulling the Smart Buoy

Surface and Mid-Depth temperatures were ABOVE 2024 levels for most of the summer. See turnovers in September and October.

Looking at (many more) Temperatures

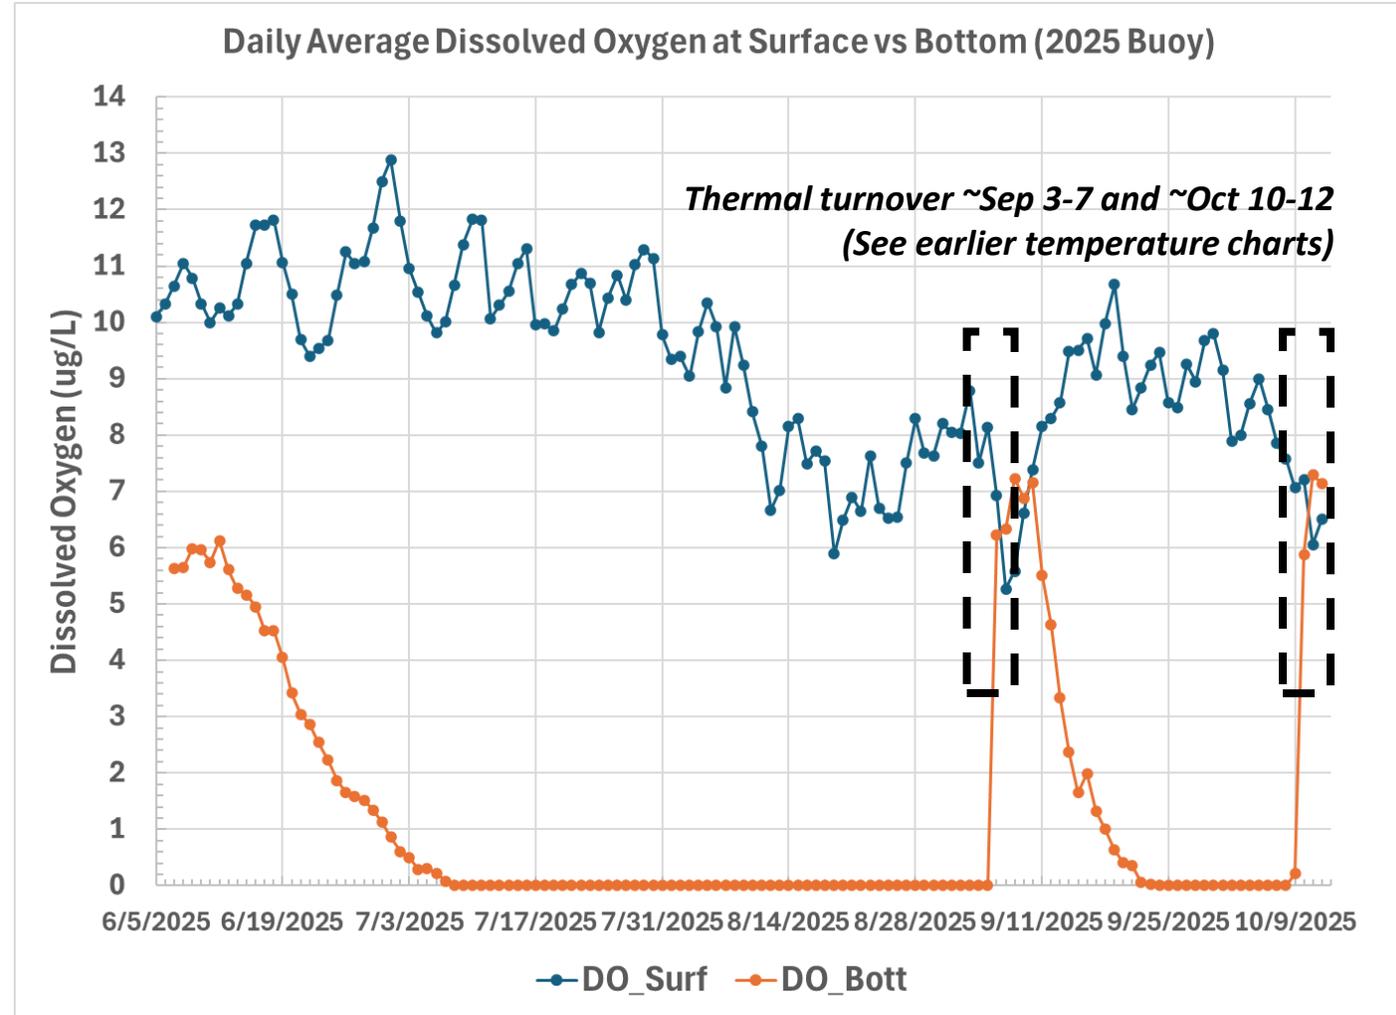

- Even after averaging daily temperatures at each point in thermistor string, one can see this is a massive data set
- Interesting spikes/variations can be seen in the 2025 data
 - A temporary “collapsing” of mid to shallow depth water column temperatures ~Jun 20
 - Strange behavior on Jun 5th is due to buoy deployment on that day (thermistor string was bundled on surface until ~Noon, where it then stabilized to temperatures at depth)
- We were fortunate to observe the Fall thermocline inversion in early-mid Oct
 - Can clearly see “Summer Stratification” phase (relatively wide band of temperature between surface and bottom) and Fall turnover

As expected, we observed more uniform temperatures throughout the water column as mixing and turnover occurred in October (right before pulling the Smart Buoy), may catch Spring turnover in 2026

Looking at Dissolved Oxygen

- Dissolved Oxygen at the bottom of White Lake (~71ft) reached 0 on ~Jul 8
 - This is the first time we've seen this data (all historical manual collections were made at the two CLMP sites, ~55ft depth)
- We observed early, temporary thermal turnover ~Sep 3-7 (see earlier charts)
 - This led to temporary recovery/uniformity of Dissolved Oxygen in the water column
- We observed similar behavior in the early-mid October timeframe during the “official” Fall turnover
 - This was part of the motivation to keep the buoy deployed through mid October

The high frequency and accuracy of dissolved oxygen measurements with the Smart Buoy at both the surface and bottom of the lake are extremely valuable for understanding conditions for plant and fish life

Looking at Manual vs Smart Buoy Temperature Measurements

- Manual water sampling involves reading temperatures from the Dissolved Oxygen (D.O.) probe as it is lowered into the water
- The exact date/time of a manual collection earlier this year near Dowie's Point (White Lake – EAST) provides the best direct comparison of temperature measurements
 - Selected July 28, 2025 (sample collected at 3:50 PM on a sunny afternoon)

From Manual Collection:

From Smart Buoy:

UTC Time	Temp_Surf	Temp_5ft	Temp_10ft	Temp_15ft	Temp_20ft	Temp_25ft	Temp_30ft	Temp_35ft	Temp_40ft	Temp_45ft	Temp_50ft	Temp_55ft	Temp_60ft	Temp_65ft	Temp_Bott
	F	F	F	F	F	F	F	F	F	F	F	F	F	F	F
7/28/2025 15:50	82.31	81.39	80.06	76.49	74.45	71.29	67.17	64.79	62.48	61.6	61.19	60.77	60.67	60.51	60.46

An initial glance suggests the measurements are very similar, plotting helps visualize the two measurements (different depth breakpoints)

Looking at Manual vs Smart Buoy Temperature Measurements, cont.

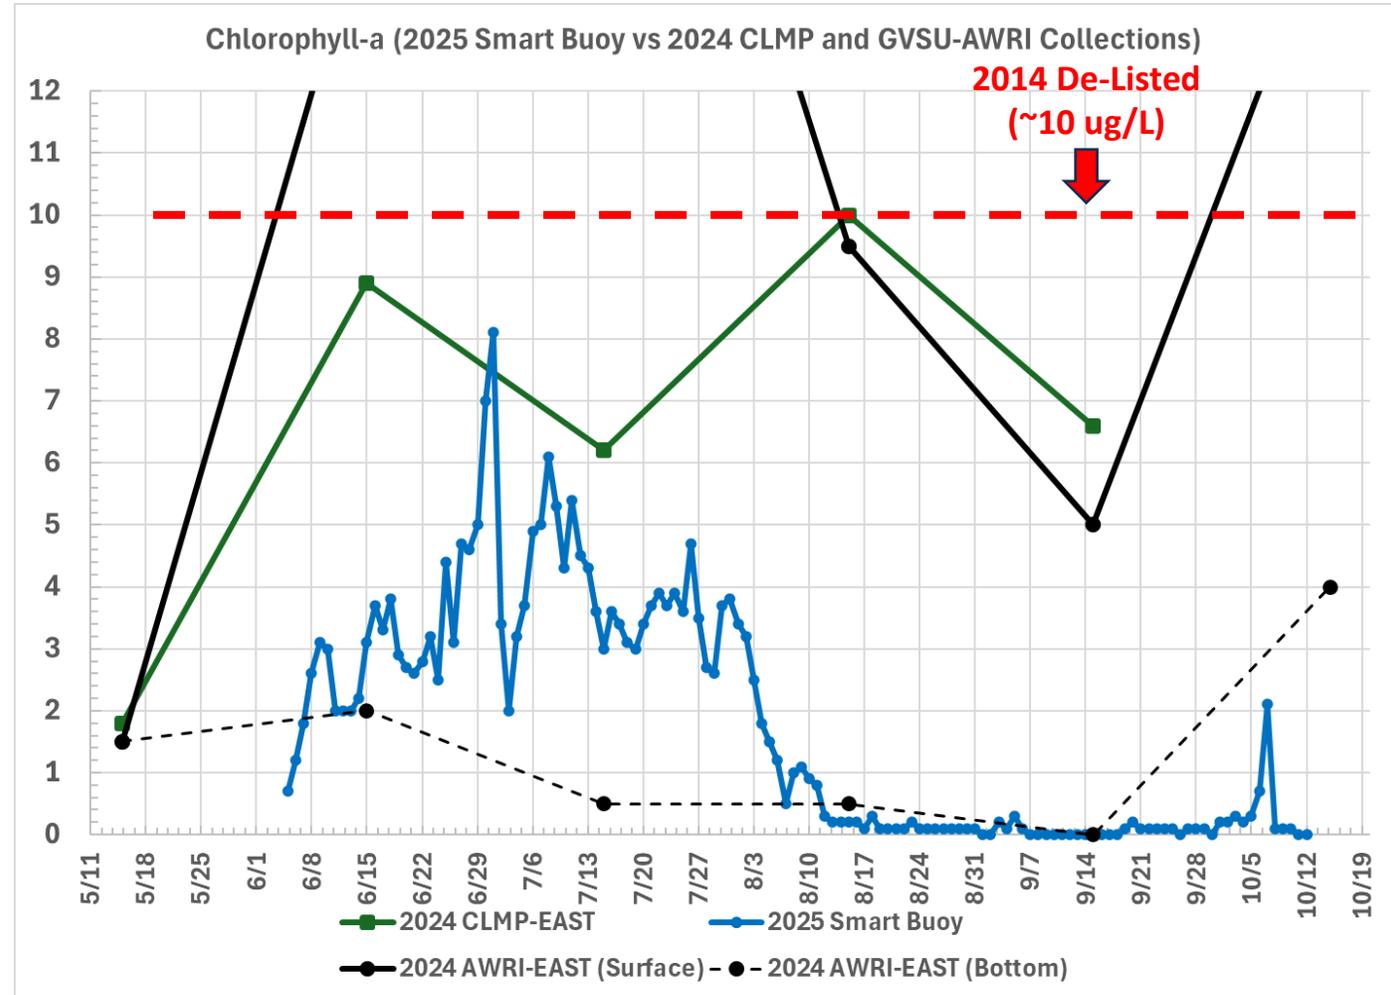

- The two measurement sources show excellent agreement
 - Largest differences are at depths that aren't common between the two sources
 - Some difference is expected due to different measurement locations
- Smart Buoy has advantage of deeper measurement (70ft), updated every 10 min

All temperature analysis thus far suggests high confidence in Smart Buoy thermistor accuracy and reliability

Looking at Chlorophyll-a

- 2025 Smart buoy measurements are all near the surface (typically “worst case” due to higher solar loading)
 - CLMP requires “composite depth sampling” (2X Secchi depth)
 - GVSU/AWRI reported surface and bottom sampling (large variation in C-a levels)
- All 2025 daily averages have been below delisting requirement of 10 ug/L
- All 2025 daily averages are well below 2024 CLMP-EAST and (especially) AWRI-EAST levels
 - Can specific day of sampling, relative volatility in June/July, and/or depth of sampling account for the large C-a discrepancies b/w CLMP & AWRI?

Buoy-based Chlorophyll-a levels are at or below levels in 2024, will be interesting to compare 2025 buoy data to eventual 2025 CLMP report. Also, AWRI saw spike in C-a in October '24 (similar with Buoy).

Start of Watershed Management Plan Discussion

White River Watershed Management Plan – Potential Update?

- The White River Watershed Partnership (WRWP) compiled an excellent, highly-detailed (667 pages!!) plan in 2009
 - Link: <https://whiteriverwp.org/wp-content/uploads/2025/07/White-River-Watershed-Management-Plan-with-Appendices-1.pdf>
 - Also posting to WLA website
- The plan contains valuable maps of the watershed, which is split into (10) “sub-watersheds” to organize analysis and implementation plans/goals
- **Funding sources exist to develop/update a watershed management plan, but still a significant endeavor**
 - Update the maps
 - Status progress toward original goals (7 for White Lake)
 - Revisit the target audience section
 - Re-focus priorities/efforts over next 10-15 years
 - All the above would likely be ~80% of the effort

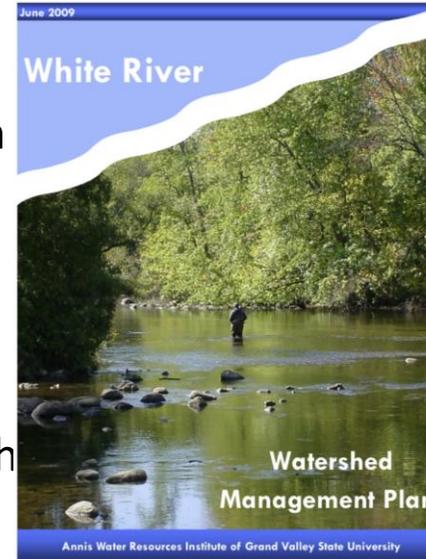

Figure 5. Individuals involved in the creation of the White River Watershed Management Plan. Pictured from left to right: Mary Fales (MDEQ), Jay Peasley (WRWP), Tom Hamilton (WRWP/WLPAC), Rich O'Neal (MDNR), Tom Thompson (WRWP), Phil Dakin (WLA), Ray Schinler (WRWP). Not pictured: Jeff Auch (MCD), Kelly Bishop (WRWP/NRCS), Terry Clark (WRWP), Dave Cordray (WRWP), Jim Cordray (WRWP), and Tom Walter (USFS). Photo taken by Nichol De Mol in 6/2008.

1.5 Who helps to develop a watershed management plan?

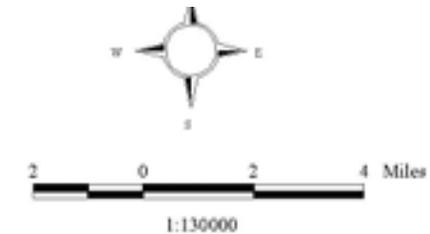

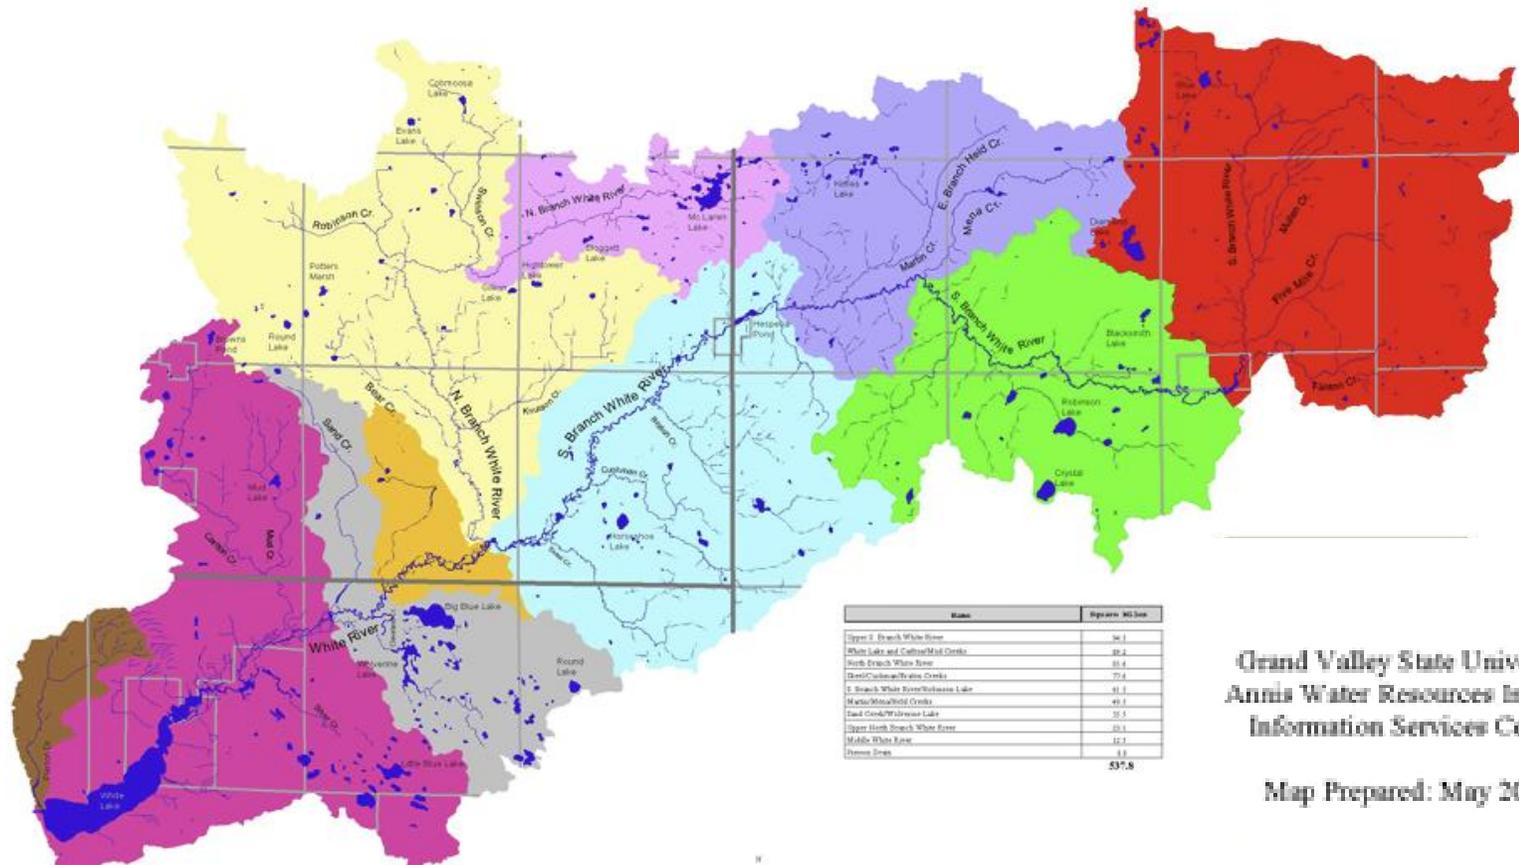

For a watershed management plan to be successful, there needs to be a dedicated group of local people involved in its creation. This involvement will ensure long-term success. In developing the White River Watershed Management Plan there were several committed individuals from the White River Watershed Partnership (WRWP), the White Lake Association (WLA), the White Lake Public Advisory Council (WLPAC), the Muskegon Conservation District (MCD), the Michigan Department of Environmental Quality (MDEQ), the Michigan Department of Natural Resources (MDNR), the Natural Resources Conservation Service (NRCS), and the United States Forest Service (USFS) (Figure 5). These partners are committed to carry out goals and objectives outlined in the plan to protect the White River Watershed.

The existing (2009) watershed management plan developed by WRWP is a fantastic, thorough document that WLA highly recommends reviewing and commenting on

White River Watershed Management Plan – Highlights

Subwatersheds

White River Watershed

Name	Square Miles
Upper S. Branch White River	34.1
White Lake and Carlton/Mud Creeks	29.2
North Branch White River	35.4
Skrell/Cushman/Braton Creeks	77.4
S. Branch White River/Robinson Lake	41.1
Martin/Mesa/Held Creeks	49.1
Sand Creek/Wolverine Lake	35.1
Upper North Branch White River	25.1
Middle White River	12.1
Pearson Drain	1.1
Total	337.6

Grand Valley State University
Annis Water Resources Institute
Information Services Center

Map Prepared: May 2002

Data Sources: Base is from MDNR
Land and Mineral Services Division,
Resource Mapping and Aerial Photography Section, 2001.

Subwatersheds developed by the Michigan
Department of Environmental Quality,
Land and Water Management Division,
Hydrologic Studies Unit, 1998.

The White River Watershed is split into (10) “sub-watersheds”, which enables identification of area-specific pollutants and prioritization based on criticality and need for protection

White River Watershed Management Plan – Highlights, cont.

White River Watershed Critical Area Analysis

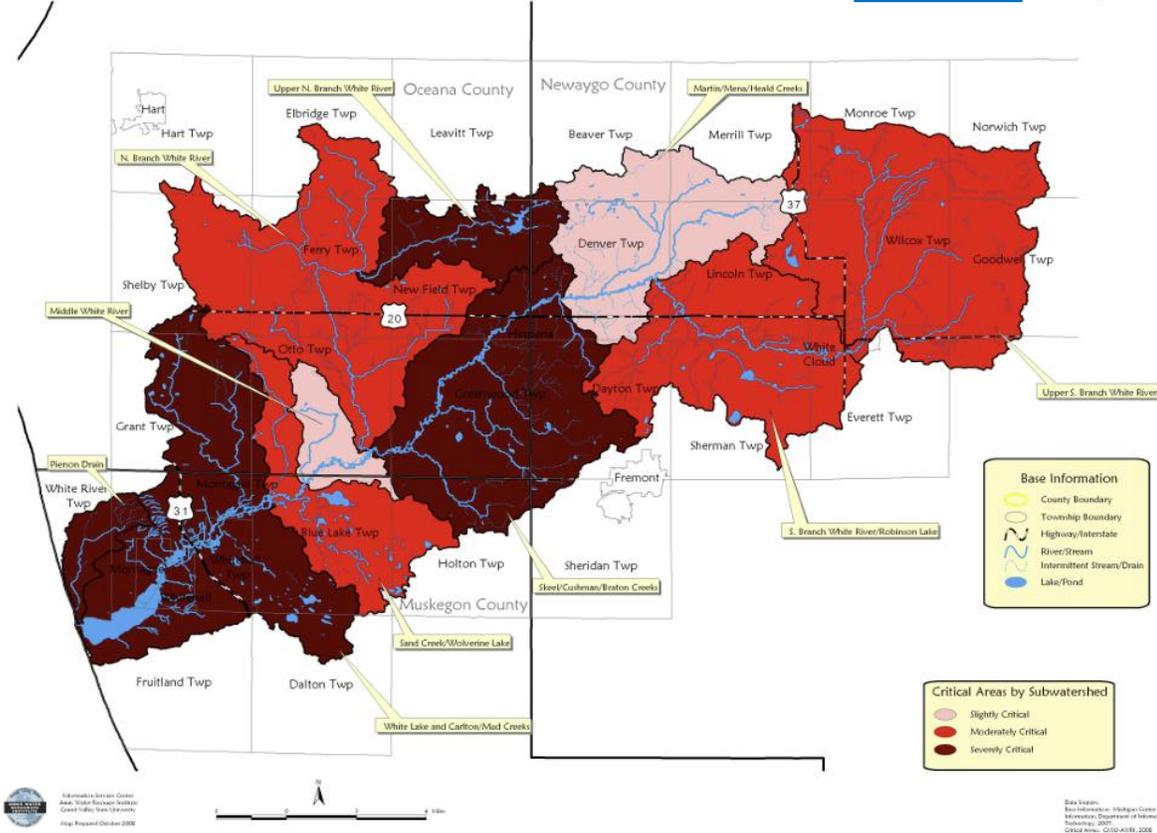

Figure 32. Critical Areas in the White River Watershed. Produced by AWRI-GVSU, October 2008.

White River Watershed Protection Area Analysis

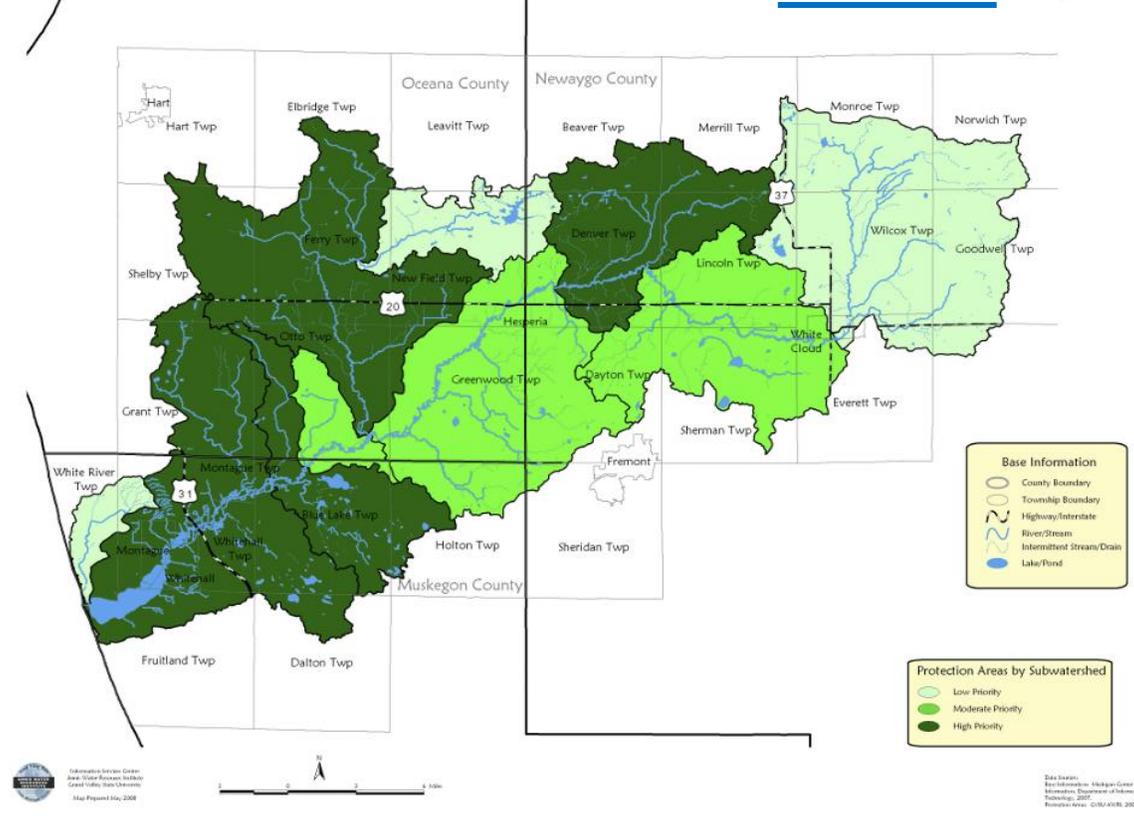

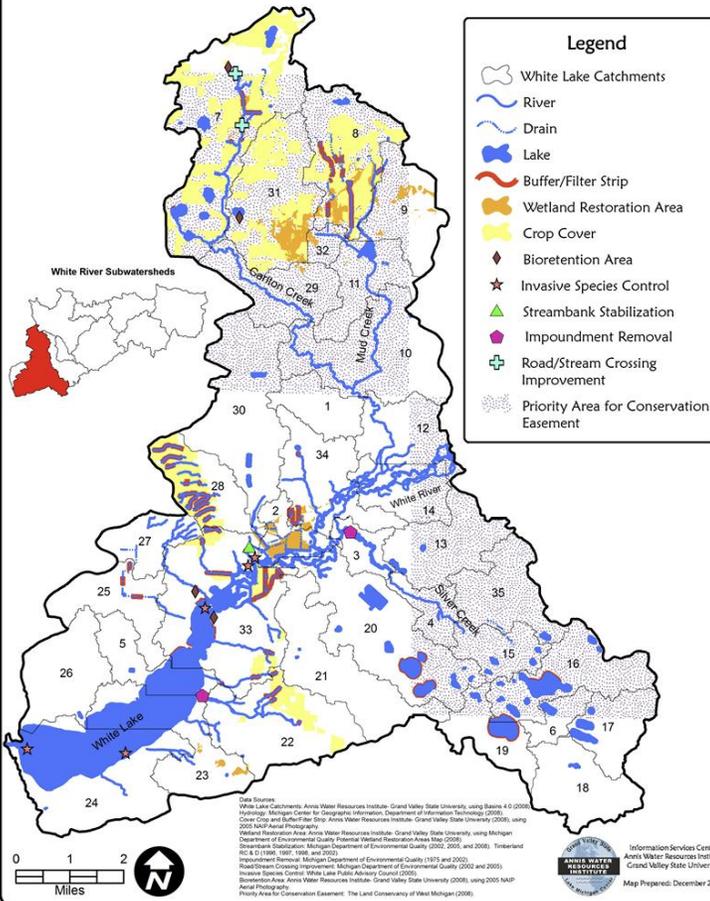

Figure 33. Protection Areas in the White River Watershed. Produced by AWRI-GVSU, May 2008.

The White Lake & Carlton/Mud Creek sub-watershed was categorized in 2009 as BOTH a “Severely Critical” and “Prioritized Protection” area

White River Watershed Management Plan – Highlights, cont.

Goal	Objective	Performance Measure	Task	Estimated Cost for Subwatershed	Estimated Cost for B.M.U.	Technical Support for Subwatershed	Regulatory Authority for Subwatershed	Responsible Authority for Subwatershed	Possible Funding Sources for Subwatershed
Goal Nine: Reduce general farm and residential nonpoint runoff	Reduce general farm and residential nonpoint runoff	Reduce general farm and residential nonpoint runoff	Work with landowners to install 2000 acres of vegetative strip along water bodies	\$1,000,000	\$1,000,000	NRMS, Michigan Department of Natural Resources, Michigan Department of Environmental Quality	NRMS, Michigan Department of Natural Resources, Michigan Department of Environmental Quality	NRMS, Michigan Department of Natural Resources, Michigan Department of Environmental Quality	NRMS, Michigan Department of Natural Resources, Michigan Department of Environmental Quality

A highly detailed, phased “Best Management Practices” plan was developed for the White Lake & Carlton/Mud Creek sub-watershed area (7 top level “goals”) – this should be reviewed/revisited

White River Watershed Management Plan – Highlights, cont.

White River Watershed

The White River Watershed covers parts of Muskegon, Newaygo, and Oceana Counties. The White River, which includes its North and South Branches, drains a watershed of over 340,000 acres and includes about 253 miles of streams and 20 major lakes.

12. For information about environmental issues, indicate how important the following **sources** are to you:

	Very Important	Somewhat important	Not important		Very Important	Somewhat important	Not important
Local officials	41.6	35.5	13.4	Environmental groups	45.0	36.6	9.1
State officials	40.5	41.8	9.3	University scientists	42.0	36.4	9.1
Federal officials	30.7	42.0	15.8	Fellow workers	17.3	39.6	25.1
Family and friends	35.3	42.8	11.2	Newspapers	31.2	46.1	12.6
Church leaders	12.5	30.5	41.8	TV and radio	34.9	42.6	12.8
Business leaders	19.9	39.6	27.0	Internet	23.4	37.7	24.7

17. Please indicate which of the following **ACTIONS** you believe are best at protecting water quality in the watershed:

	Most effective	Somewhat effective	Least effective	Not effective	Not sure
Stop mowing to allow native plants to grow at water's edge	21.4	42.0	7.2	7.6	14.1
Avoiding the use of salt to melt snow and ice	31.2	45.4	6.3	2.6	9.5
Quickly covering exposed soil with plants, seed or mulch	38.8	37.4	5.8	1.5	9.5
Reducing pavement or other hard surfaces on property	20.8	33.6	18.8	9.7	11.7
Testing soils before applying fertilizers	39.8	36.4	7.6	2.8	8.0
Using fertilizers without phosphorous	53.0	28.1	3.2	1.9	9.3
Avoiding the use of weed killers	44.2	30.5	8.0	2.0	10.6
Using nontoxic cleaning products	48.9	32.7	5.5	2.4	6.7
Pumping out a septic tank every 3 to 5 years	32.9	30.3	11.7	6.3	14.5
Promptly picking up pet waste when outdoors	22.1	25.8	23.2	14.9	9.3
Washing cars over grassy areas away from storm drains	26.4	42.0	12.8	3.0	8.9
Quickly repairing leaking fluids from cars	57.1	27.5	6.1	1.1	4.5
Paying more attention to water quality issues	58.6	31.0	1.3	1.1	3.7
Volunteering to clean up rivers and streams	37.7	42.4	5.8	1.7	5.9

A significant portion of the watershed management plan development consisted of a social survey and profile to gauge awareness/interest of the public in the health/value of the watershed

White River Watershed Management Plan – Highlights, cont.

- The earlier survey of **riparian landowners** highlight the critical role they will play in water quality improvements in the watershed. In contrast to other watershed residents, riparian owners were able to assess the condition of water quality plus they considered it the most important feature to protect. They viewed the goal for their property as a heritage to pass to their family and to maintain it in a natural condition. They believed the lack of information was the greatest barrier to protecting the river.
- There is a great **willingness to act in support** of the White River Watershed if residents know specifically what to do, as survey respondents often indicate. However, knowledge alone does not induce action. Individuals and organizations, as research has demonstrated, will take ownership and take action if they are clear about what must be done and if they have personal control over most aspects of the decisions. The effectiveness of actions to protect the watershed, as presented in the watershed survey, demonstrates the need to more thoroughly educate watershed residents about those practices they can implement.
- In the course of a lifetime, an individual may accumulate knowledge about water quality from a combination of schools, the Internet, other media, books, family and friends, outdoor activities, entertainment, and a wide range of other experiences. For a few motivated individuals, these **learning experiences** may eventually lead to taking true watershed actions.
- As these surveys suggest, watershed residents possess **local knowledge** that is specific and tuned into local conditions as they perceive them. While watershed planning has identified pollution sources and causes and reduced them further into discrete components for analysis and planning, local knowledge and local willingness to act will remain an integral component in how well the watershed will be managed and how successfully water quality can be improved.
- One of the main underlying themes that arose during the survey process is the great appreciation of the watershed's natural resources – including its water, wildlife, and forests – with the recognized need to protect and preserve them while securing economic viability and balancing development.
- Changing demographics many result in changing priorities in the watershed, perhaps impacting how actions to protect water quality will be valued relative to other priorities. It has been suggested that as income levels and education attainment rise, residents will more likely be engaged in their communities and, possibly, in watershed affairs. Whether **past trends** will be a factor in the future, such as expanding second home development in the watershed, is difficult to forecast

I really know nothing about the watershed as I **moved to this area** 3 1/2 years ago. I am concerned about over-building, waste, sewer, etc. We need to pay attention to our land so our future generations have a clean place to live. Maybe we need more info in school classes, public meetings, etc. To inform people how to treat our great earth. Sincerely,

What are the affects of weekly **fireworks** on the lakes in the summer months?

One of my personal concerns with our water quality is how it directly affects the **edible quality** of our larger fish that are harvested out of the White River, especially White Lake. I am very apprehensive about consuming large fish due to the large amount of mercury, PCBs, and other toxins that are in the water and absorbed through the fish not to mention other wildlife. Even though I live less than a mile from White Lake, I do most of my fishing at other lakes that don't have the industrial past that White Lake has.

We - you - they have to deal with the excess **nutrient - fertilizer runoff** from the wetland farms upriver from White Lake. Every year commercial "safe" weed killing operations are deposited in White Lake - making it a further chemical soup - settlement ponds, buffer plantings must be created and no pumping of "harmful" waters directly into W. River. A sensitive issue!! But necessary purchasing development rights (\$) wiser use of lands?

The comment section from a survey conducted in 2009 shows several similar concerns/thoughts we are working with today (16 years later)

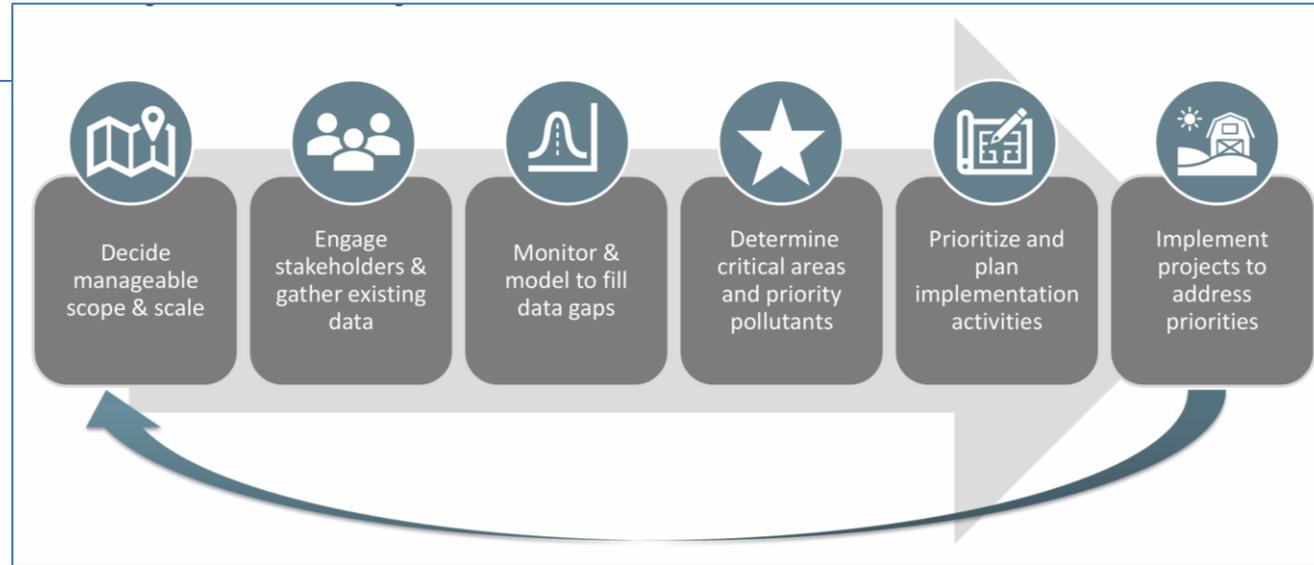

White River Watershed Management Plan – EGLE Grant

Watershed Planning RFP

- About **\$275,600** is available.
- Minimum Request: **\$25,000**
- A minimum **10%** local match is required.

$$\begin{array}{rcl} \$25,000 & + & \$2,778 \\ \textit{Grant Request} & & \textit{Local Match} \\ & & \textit{(10\% of project total)} \\ & = & \$27,778 \\ & & \textit{Project Total} \end{array}$$

- **Update** an existing (less than 10 years old) plan -OR- produce a **new** plan.
- Timeline: 2-3 years

Should we try to submit a proposal for a multi-year, multi-partner update using EGLE grant funding (requires 10% match from another entity – Cities of Montague & Whitehall?)

White River Watershed Management Plan – EGLE Grant, cont.

Schedule

- RFP released Wednesday, September 3, 2025.
- Full proposals submitted by 11:59 pm on Monday, October 6, 2025 via email
- Anticipate awarding funds for successful projects Summer 2026.

Eligible Activities

- Consistent with NPS Program Plan.
- Activities to develop or update an approvable plan.

Examples include:

- Stakeholder/Workgroup Meetings
- Environmental and Social Monitoring
- Inventories
- Policy Reviews
- Information and Education
- Writing the Plan

Watershed Management Planning Guidance and Criteria

Three types of projects will be considered:

1. Development of new watershed management plans.
2. Complete updates of previously approved outdated watershed management plans (15+ years old).
3. Technical updates of current approved watershed management plans (less than 10 years old).

All projects must:

- Result in a USEPA nine-element approvable watershed management plan.
- Be hydrologically based.
- Include a list of targeted pollutants.
- Consider wetlands ([Appendix B](#)).
- Include a shapefile.
 - Contact Peter Vincent for help, VincentP@Michigan.gov

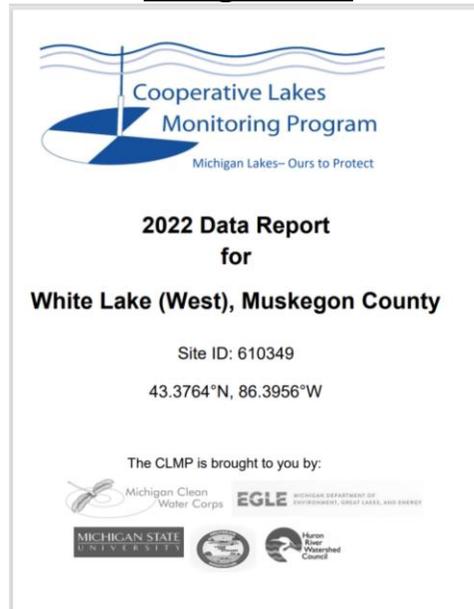

The rapidly approaching submittal deadline likely makes this a bridge too far, BUT it would be good to review and prepare material in order to submit a high quality proposal at this time in 2026

White Lake Area of Concern (AOC) History

2.3 Historical Information

Over the years, much has been written and otherwise documented about the history of industrial and municipal pollution at White Lake. There is a great deal of information available from various sources regarding the cleanup and restoration efforts resulting in the delisting of the White Lake AOC. www.restoringwhitelake.com has a wealth of historical information and details of restoration projects completed at White Lake. It includes a timeline (Figure 3), which provides an abbreviated summary of important events that have impacted the lake and the community: http://restoringwhitelake.com/restoration_history_timeline.pdf. A 1968 Life Magazine article about extensive pollution throughout the Great Lakes includes dramatic photos and mentions White Lake, along with other future AOCs: http://restoringwhitelake.com/Life_BlightedGreatLakes_082368.pdf

At least two documentary films were made detailing industrial pollution and impacts to the surrounding communities. "The Tragedy of White Lake" was produced in 1978 and is available online here: http://www.youtube.com/watch?v=5d_J_05ljvU. "This is Not a Chocolate Factory" was produced in the early 2000s and can also be found online: <http://www.youtube.com/watch?v=b5Oe1GzMIjXg>.

RESTORING WHITE LAKE

EXPLORING WHITE LAKE'S ENVIRONMENTAL HISTORY

The goal of the White Lake Environmental History Project is to help residents and visitors of the area to learn about and understand the impact of White Lake's environmental history, including pollution issues and restoration efforts.

The Early Days

- 1700s - 1800s ... Fur trading
- 1827 ... First sawmill on White Lake established by Charles Meers
- 1837 - 1900 ... Logging practices, including the channeling of the White River system, drastically changed the White River and White Lake by causing sedimentation and decreasing the capacity of the wetlands to reduce nutrient loads, absorb floods, and filter water
- 1860 ... Meers/Whitall started
- 1905 ... Eagle Tanning Works (Whitall Leather Company) opens
- 1927 ... Muskegon plant
- Late 1800s/early 1900s ... End of logging era

1910s - 1920s

- 1905 ... Whitall Leather Company stopped using bark for tanning and began using chromium
- 1911 ... Meers opens Hooker Chemical opens
- 1924 ... Hooker Chemical opens
- 1926 ... E.I. duPont de Nemours opens

1930s

- 1917 ... State of Michigan documents steep decline in bass and high levels of sodium chloride at Hooker Chemical discharge site
- 1928 ... DuPont closes Hooker Chemical/OxyChem
- 1937 ... OxyChem closes Hooker Chemical/OxyChem
- 1938 ... White Lake named an Area of Concern
- 1939 ... Hooker Chemical purchases Muskegon Chemical

1940s

- 1944 ... Industrial and municipal discharges diverted from White Lake to nearby wastewater site
- 1945 ... Muskegon Chemical opens
- 1947 ... Groundwater contamination found at Hooker Chemical
- 1948 ... Hooker Chemical/OxyChem closes
- 1949 ... Hooker Chemical/OxyChem production facilities demolished

1950s

- 1950 ... Whitall municipal well #3 discovered to be contaminated
- 1951 ... Hooker Chemical/OxyChem investigation and cleanup of soils
- 1952 ... Groundwater cleanup begins at Hooker Chemical/OxyChem
- 1953 ... Hooker Chemical/OxyChem closes
- 1954 ... White Lake named an Area of Concern
- 1955 ... Hooker Chemical/OxyChem production facilities demolished
- 1956 ... Hooker Chemical/OxyChem production facilities demolished
- 1957 ... E.I. duPont de Nemours closes
- 1958 ... White Lake Landfill closes

1960s

- 1961 ... Muskegon Chemical foot chemical closes
- 1962 ... White Lake Public Advisory Council (PAC) established
- 1963 ... EPA orders Hooker Chemical/OxyChem to conduct second site investigation
- 1964 ... Whitall Leather Company land site and Tannery Bay investigation begins
- 1965 ... 3 problems were officially determined for the White Lake Area of Concern
- 1966 ... Hooker Chemical/OxyChem production facilities demolished
- 1967 ... E.I. duPont de Nemours closes
- 1968 ... E.I. duPont de Nemours facility demolished
- 1969 ... White Lake Landfill closes

1970s

- 1970 ... Whitall Leather Company removes contaminated sediments from Tannery Bay in White Lake
- 1971 ... Hooker Chemical/OxyChem removes contaminated sediments from White Lake
- 1972 ... Habitat restoration project
- 1973 ... 3 of 8 problems officially removed for the White Lake Area of Concern

1980s

- 1985 ... E.I. duPont investigation begins
- 1986 ... Whitall Leather Company land site cleanup begins
- 1987 ... Habitat restoration project
- 1988 ... 3 of 8 problems officially removed for the White Lake Area of Concern

1990s

- 1991 ... Muskegon Chemical foot chemical closes
- 1992 ... Whitall Leather Company land site cleanup begins
- 1993 ... Habitat restoration project
- 1994 ... 3 of 8 problems officially removed for the White Lake Area of Concern

2000s

- 2000 ... Whitall Leather Company land site cleanup begins
- 2001 ... Habitat restoration project
- 2002 ... 3 of 8 problems officially removed for the White Lake Area of Concern

2010s

- 2010 ... E.I. duPont investigation begins
- 2011 ... Whitall Leather Company land site cleanup begins
- 2012 ... Habitat restoration project
- 2013 ... 3 of 8 problems officially removed for the White Lake Area of Concern

The Future

- Area of Concern delisting
- Cities and businesses strive to be good environmental stewards

CONTAMINATED SITES

- Muskegon Chemical Foot Chemical
- E.I. duPont de Nemours
- Hooker Chemical/OxyChem
- Whitall Leather Company
- White Lake Landfill
- Shellac
- Muskegon County Wastewater Management Site - Whitall
- Tannery Bay
- Alcoa Hopper (Formerly Meers)
- Whitall Municipal Well #3
- S-A Oil

An industrial era, beginning in the 1950s, caused serious environmental problems in and around White Lake. Pollution from this chemical manufacturing era and other problems caused White Lake to be placed on an international list of "toxic hotspots" called Areas of Concern in 1985. Please note that not every site of contamination is listed on this display.

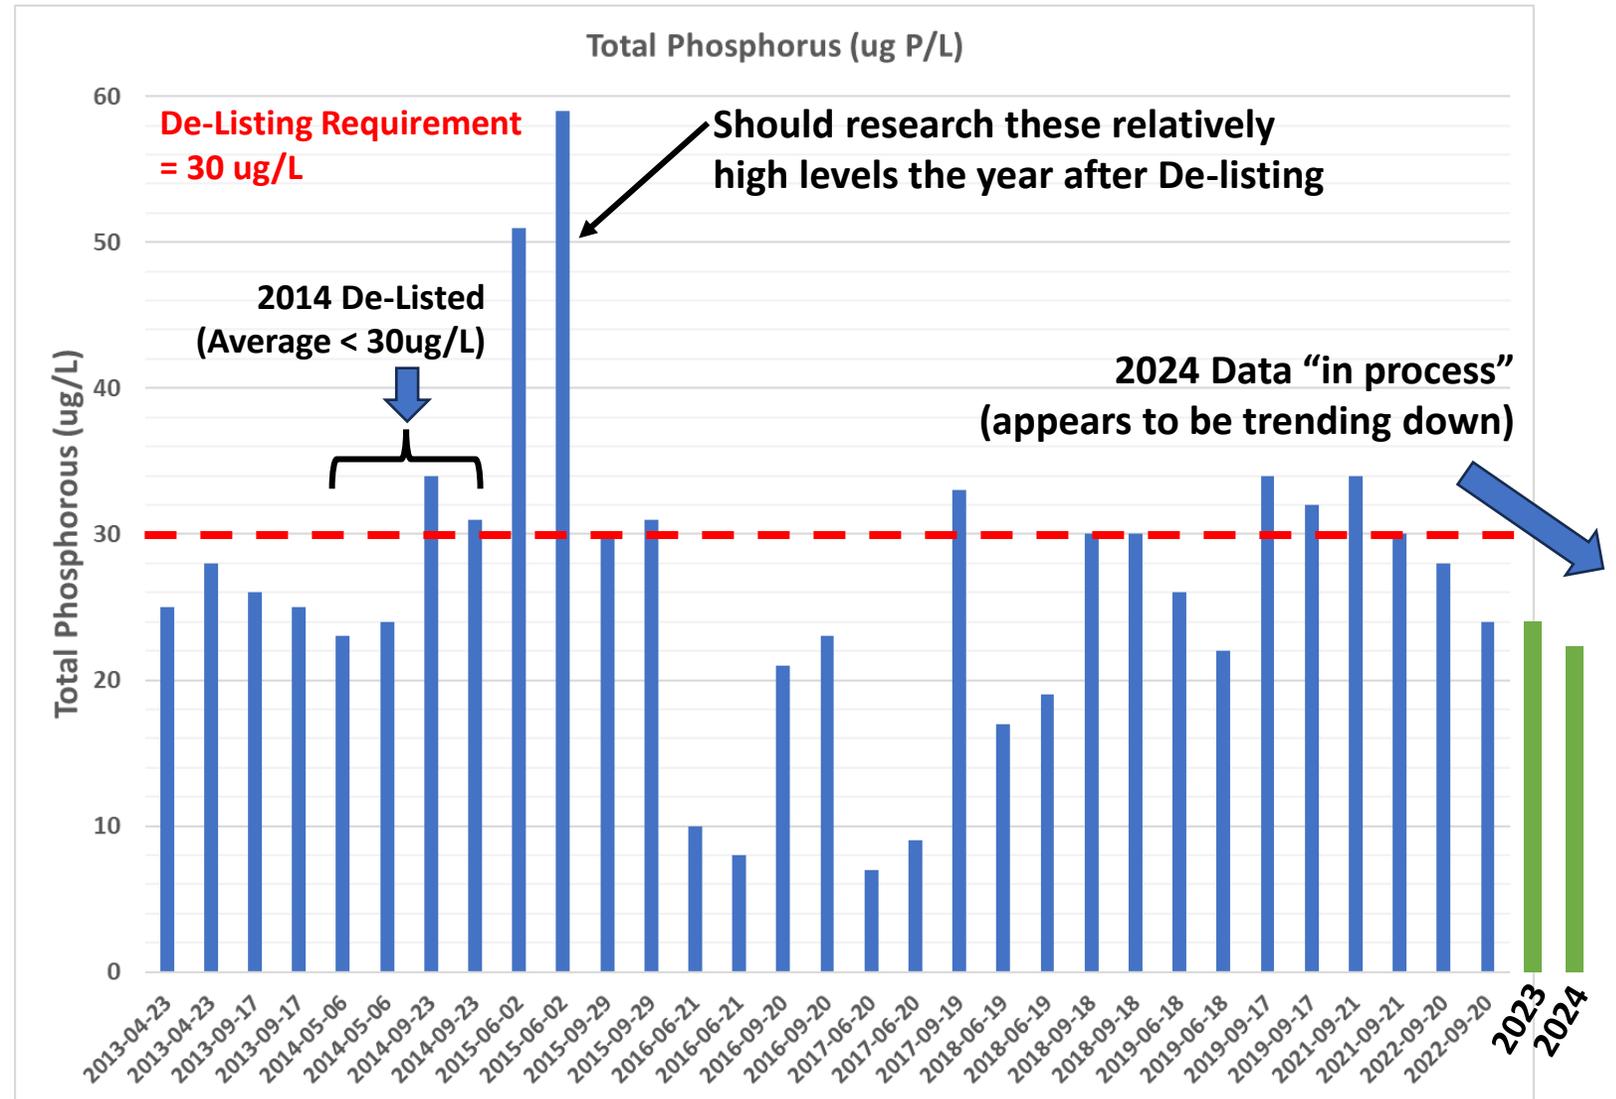

Fortunately, a variety of public and private cleanup efforts have led to dramatic improvements in water quality of White Lake over the past three decades; efforts which now allow for all recreational uses to be safely enjoyed - boating, swimming, fishing.

The White Lake Environmental History Project was made possible by:

Muskegon County, Alcoa Hopper, WLCF, Muskegon County Wastewater Management Site, Whitall, Tannery Bay, Alcoa Hopper (Formerly Meers), Whitall Municipal Well #3, S-A Oil.

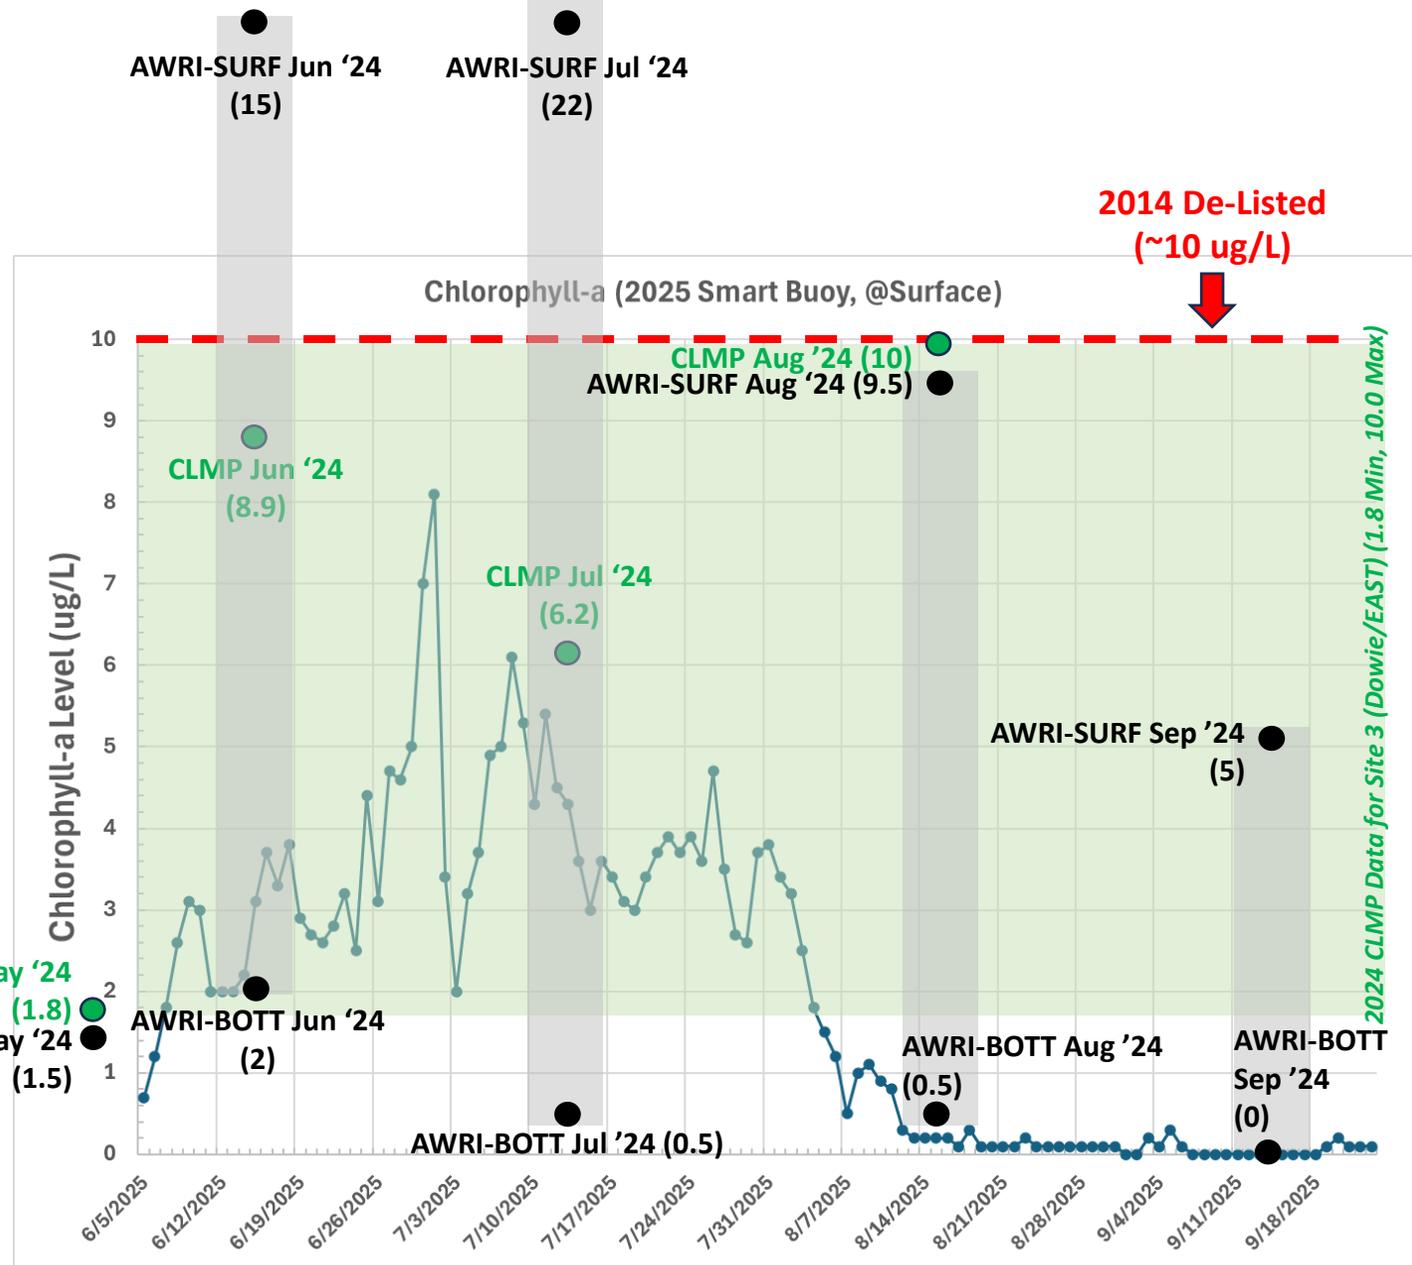

White Lake Historical Data Trends (Phosphorous)

- Varying Phosphorous levels since De-Listing, recently trending down

Looking at Chlorophyll-a

- 2025 Smart buoy measurements are all near the surface (typically “worst case” due to higher solar loading)
 - CLMP requires “composite depth sampling” (2X Secchi depth)
 - GVSU/AWRI reported surface and bottom sampling (large variation in C-a levels)
- All 2025 daily averages have been below delisting requirement of 10 ug/L
- All 2025 daily averages are well below 2024 CLMP-EAST and (especially) AWRI-EAST levels
 - Can specific day of sampling, relative volatility in June/July, and/or depth of sampling account for the large C-a discrepancies b/w CLMP & AWRI?

Buoy-based Chlorophyll-a levels are at or below levels in 2024, will be interesting to compare 2025 buoy data to eventual 2025 CLMP report. Also, AWRI saw spike in C-a at Site 3 in October '24 (check buoy).
